# Data import with the tidyverse:: cheatsheet

# Read Tabular Data with readr

read\_\*(file, col\_names = TRUE, col\_types = NULL, col\_select = NULL, id = NULL, locale, n\_max = Inf, skip = 0, na = c("", "NA"), guess\_max = min(1000, n\_max), show\_col\_types = TRUE) See ?read\_delim

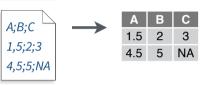

read\_delim("file.txt", delim = "|") Read files with any delimiter. If no delimiter is specified, it will automatically guess.

To make file.txt, run: write file("A|B|C\n1|2|3\n4|5|NA", file = "file.txt")

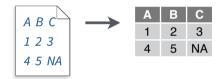

read\_csv("file.csv") Read a comma delimited file with period decimal marks.

write file("A,B,C\n1,2,3\n4,5,NA", file = "file.csv")

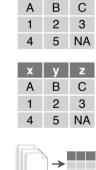

read\_csv2("file2.csv") Read semicolon delimited files with comma decimal marks.

write file("A;B;C\n1,5;2;3\n4,5;5;NA", file = "file2.csv")

read\_tsv("file.tsv") Read a tab delimited file. Also read\_table(). **read\_fwf(**"file.tsv", fwf\_widths(c(2, 2, NA))) Read a fixed width file.  $write_file("A\tB\tC\n1\t2\t3\n4\t5\tNA\n", file = "file.tsv")$ 

### **USEFUL READ ARGUMENTS**

#### No header

read csv("file.csv", col names = FALSE)

### **Provide header**

read\_csv("file.csv". col\_names = c("x", "y", "z"))

# Read multiple files into a single table

read\_csv(c("f1.csv", "f2.csv", "f3.csv"), id = "origin\_file")

### Skip lines

read csv("file.csv", skip = 1)

### Read a subset of lines read csv("file.csv", n max = 1)

# Read values as missing

read\_csv("file.csv", **na** = **c("1")**)

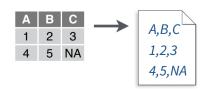

## A;B;C1,5;2;3,0

### **Specify decimal marks**

read delim("file2.csv", locale = locale(decimal\_mark = ","))

# Save Data with readr

write \*(x, file, na = "NA", append, col names, quote, escape, eol, num threads, progress)

write\_delim(x, file, delim = " ") Write files with any delimiter.

write\_csv(x, file) Write a comma delimited file.

write\_csv2(x, file) Write a semicolon delimited file.

write\_tsv(x, file) Write a tab delimited file.

One of the first steps of a project is to import outside data into R. Data is often stored in tabular formats, like csv files or spreadsheets.

The front page of this sheet shows how to import and save text files into R using **readr**.

The back page shows how to import spreadsheet data from Excel files using **readxl** or Google Sheets using googlesheets4.

### **OTHER TYPES OF DATA**

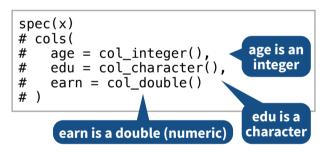

Try one of the following packages to import other types of files:

- haven SPSS, Stata, and SAS files
- **DBI** databases
- **isonlite** ison
- xml2 XML
- httr Web APIs
- rvest HTML (Web Scraping)
- readr::read\_lines() text data

# Column Specification with readr

Column specifications define what data type each column of a file will be imported as. By default readr will generate a column spec when a file is read and output a summary.

**spec(x)** Extract the full column specification for the given imported data frame.

### **COLUMN TYPES**

Each column type has a function and corresponding string abbreviation.

- col\_logical() "l"
- col\_integer() "i"
- col\_double() "d"
- col\_number() "n"
- col character() "c"
- col\_factor(levels, ordered = FALSE) "f"
- col\_datetime(format = "") "T"
- col\_date(format = "") "D"
- col\_time(format = "") "t"
- col\_skip() "-", "\_"
- col guess() "?"

### **USEFUL COLUMN ARGUMENTS**

### Hide col spec message

read \*(file, show col types = FALSE)

### **Select columns to import**

Use names, position, or selection helpers. read \*(file, col select = c(age, earn))

### **Guess column types**

To guess a column type, read \*() looks at the first 1000 rows of data. Increase with guess\_max. read\_\*(file, guess\_max = Inf)

### **DEFINE COLUMN SPECIFICATION**

### Set a default type

read\_csv( file, col type = list(.default = col double())

### Use column type or string abbreviation

read csv( file,  $col_{type} = list(x = col_{double}(), y = "l", z = "_")$ 

### Use a single string of abbreviations

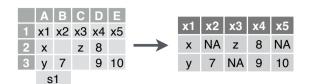

# col types: skip, guess, integer, logical, character read\_csv( col\_type = "\_?ilc"

# **Import Spreadsheets**

# with readxl

### **READ EXCEL FILES**

read\_excel(path, sheet = NULL, range = NULL) Read a .xls or .xlsx file based on the file extension. See front page for more read arguments. Also read\_xls() and read\_xlsx().

read\_excel("excel\_file.xlsx")

#### **READ SHEETS**

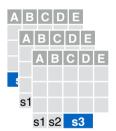

read\_excel(path, sheet = **NULL)** Specify which sheet to read by position or name.

read\_excel(path, sheet = 1) read\_excel(path, sheet = "s1")

excel\_sheets(path) Get a vector of sheet names.

excel sheets("excel file.xlsx")

### To read multiple sheets:

- 1. Get a vector of sheet names from the file path.
- 2. Set the vector names to be the sheet names.
- 3. Use purrr::map() and purrr::list rbind() to read multiple files into one

path <- "your\_file\_path.xlsx" data frame. path |> excel\_sheets() |> set\_names() |> map(read\_excel, path = path) |> list\_rbind()

#### **OTHER USEFUL EXCEL PACKAGES**

For functions to write data to Excel files, see:

- openxlsx
- writexl

For working with non-tabular Excel data, see:

tidyxl

### **READXL COLUMN SPECIFICATION**

Column specifications define what data type each column of a file will be imported as.

Use the col types argument of read excel() to set the column specification.

### **Guess column types**

To guess a column type, read excel() looks at the first 1000 rows of data. Increase with the guess\_max argument.

read\_excel(path, guess\_max = Inf)

Set all columns to same type, e.g. character read\_excel(path, col\_types = "text")

# Set each column individually

read\_excel( path, col\_types = c("text", "guess", "guess", "numeric")

### **COLUMN TYPES**

logical	numeric	text	date	list
TRUE	2	hello	1947-01-08	hello
FALSE	3.45	world	1956-10-21	1

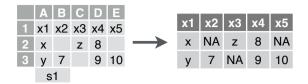

- skip
- logical
- date

- guess
- numeric list
- text

Use **list** for columns that include multiple data types. See **tidyr** and **purrr** for list-column data.

# with googlesheets4

#### **READ SHEETS**

read\_sheet(ss, sheet = NULL, range = NULL) Read a sheet from a URL, a Sheet ID, or a dribble from the googledrive package. See front page for more read arguments. Same as range\_read().

#### **SHEETS METADATA**

**URLs** are in the form:

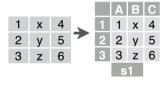

https://docs.google.com/spreadsheets/d/ SPREADSHEET ID/edit#gid=SHEET ID

gs4\_get(ss) Get spreadsheet meta data.

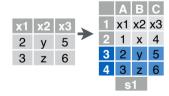

gs4\_find(...) Get data on all spreadsheet files.

sheet\_properties(ss) Get a tibble of properties for each worksheet. Also **sheet\_names()**.

### **WRITE SHEETS**

ABCD

write sheet(data, ss = NULL, sheet = NULL) Write a data frame into a new or existing Sheet.

gs4\_create(name, ..., sheets = NULL) Create a new Sheet with a vector of names, a data frame, or a (named) list of data frames.

sheet\_append(ss, data, sheet = 1) Add rows to the end of a worksheet.

# googlesheets

### **GOOGLESHEETS4 COLUMN SPECIFICATION**

Column specifications define what data type each column of a file will be imported as.

Use the col types argument of read sheet()/ range\_read() to set the column specification.

### **Guess column types**

To guess a column type read sheet()/ range\_read() looks at the first 1000 rows of data. Increase with guess\_max.

read\_sheet(path, guess\_max = Inf)

Set all columns to same type, e.g. character read\_sheet(path, col\_types = "c")

### Set each column individually

# col types: skip, guess, integer, logical, character read\_sheets(ss, col\_types = "\_?ilc")

#### **COLUMN TYPES**

1	n	С	D	L
TRUE	2	hello	1947-01-08	hello
FALSE	3.45	world	1956-10-21	1

- skip "\_" or "-"
- guess "?"
- logical "l"
- integer "i"

• numeric - "n"

- double "d"
- datetime "T"

date - "D"

- character "c"
- list-column "L"
- cell "C" Returns list of raw cell data.

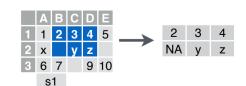

Use list for columns that include multiple data types. See **tidyr** and **purrr** for list-column data.

#### **FILE LEVEL OPERATIONS**

googlesheets4 also offers ways to modify other aspects of Sheets (e.g. freeze rows, set column width, manage (work)sheets). Go to googlesheets4.tidyverse.org to read more.

For whole-file operations (e.g. renaming, sharing, placing within a folder), see the tidyverse package **googledrive** at googledrive.tidyverse.org.

#### **CELL SPECIFICATION FOR READXL AND GOOGLESHEETS4**

Use the range argument of readxl::read\_excel() or googlesheets4::read\_sheet() to read a subset of cells from a sheet.

read\_excel(path, range = "Sheet1!B1:D2") read\_sheet(ss, range = "B1:D2")

Also use the range argument with cell specification functions cell\_limits(), cell\_rows(), cell\_cols(), and anchored().
